

Lighting looks simple until someone has to make it work without tripping a breaker, cooking a fixture, annoying the inspector, or turning a mechanical room into a cave where every service call requires a flashlight held between the teeth. That is where a capable lighting contractor earns the invoice.

Electrical installations do not live in a neat little box marked “wires only.” On real jobs, lighting crosses paths with heating, cooling, plumbing, refrigeration, ventilation, controls, access panels, drain lines, water heaters, furnaces, air handlers, and the occasional ceiling tile that has clearly given up on life. A lighting contractor may be focused on fixtures, circuits, switches, controls, and placement, but the work often has to fit around the rest of the building’s mechanical reality.

That matters because buildings are not assembled by one heroic tradesperson with a tool belt and a theme song. They are stitched together by specialists. OSHA classifies plumbing, heating, and air-conditioning work as special trade contracting, with electrical work treated separately. That distinction is not just paperwork for people who enjoy alphabetized classifications. It reflects the way work is divided in the field. The plumber handles plumbing systems. The heating contractor or air conditioning contractor handles heating, ventilation, and air-conditioning equipment. The electrician handles electrical work. The lighting contractor lives in that electrical neighborhood, often with a sharper focus on illumination, fixture layout, lighting controls, and installation details.

When these trades coordinate well, a building feels civilized. When they do not, you get a light fixture blocked by ductwork, a service panel buried behind storage racks, a furnace repair service technician working under a flickering bulb from 1997, and a homeowner wondering why the brand-new bathroom fan sounds like it is auditioning for airport runway duty.

Lighting is not decoration once installation begins

People tend to think about lighting as a design choice. Warm or cool. Bright or soft. Recessed or pendant. Sensible or “my cousin saw this on a renovation show.” But lighting contractor services for electrical installations are less about taste and more about execution.

A fixture has to be supported. A circuit has to be appropriate. A switch leg has to be where the wall actually exists, not where the blueprint thought the wall would exist before plumbing repiping changed the plan. Controls need to match how the space is used. Service areas need enough illumination for maintenance workers to see labels, valves, fittings, disconnects, and the tiny screw that inevitably rolls behind the equipment.

The “installation” part is where judgment shows. In a mechanical space, the best-looking fixture is not necessarily the best fixture. A contractor thinking like a field professional asks practical questions. Can someone servicing a water heater see the gas connection and shutoff clearly? Is there enough light at the air handler for an air

conditioning repair service call? Does the fixture location interfere with access to filters, coils, panels, piping, or ductwork? Is the lighting durable enough for the environment? Is it placed where a person can actually reach it later?

That last question sounds modest, but it has saved more knuckles than motivational posters ever will.

Where lighting meets plumbing, HVAC, and the rest of the trades

A business centered on plumbing and HVAC work may provide or coordinate services that range from air conditioning maintenance to furnace repair, drain cleaning, water heater installation, and heat pump installation. Department of Energy materials describe HVAC contractors as specialized contractors whose core business is installing and maintaining heating, ventilation, and air-conditioning equipment. Those same materials recognize that HVAC contractor services can include installation, maintenance, repairs, duct cleaning, and plumbing or electrical work associated with heating and cooling equipment.

That overlap is where lighting deserves more attention than it usually gets. The electrical work tied to HVAC equipment is not the same thing as decorative lighting, but both live in the same physical building. A lighting contractor may need to coordinate with an electrician working on equipment connections, or with a heating contractor installing a furnace, or with an air conditioning contractor handling a new cooling system. Nobody wins when a lighting layout ignores where mechanical equipment must go.

Think of a basement mechanical room. It may contain a furnace, water heater, sump-related equipment, ductwork, piping, gas installation service connections, valves, drains, and perhaps a softener. It is not glamorous. It will not be photographed for a magazine unless the magazine is called “Places Where Extension Cords Go to Die.” Yet lighting there matters. A furnace repair service technician needs clear visibility around access panels. A plumber performing plumbing leak repair needs to trace lines and see water stains. Someone doing water heater repair needs to see labels, connections, and signs of corrosion. If the space also houses HVAC components, a technician performing an air conditioning tune-up should not have to diagnose equipment under one lonely pull-chain bulb swinging like a haunted pendulum.

Good lighting supports good service. Poor lighting turns every repair into a guessing game with invoices.

The contractor boundary is important, not fussy

One of the most useful things a property owner can understand is that trade boundaries exist for reasons. Electrical work is separately classified from plumbing, heating, and air-conditioning work. That does not mean contractors never coordinate or that a company cannot offer related services through properly qualified staff. It means the work has different risks, standards, skills, and responsibilities.

A plumber may be excellent at plumbing leak repair, drain cleaning, roofer service, hydrojetting, water heater installation, plumbing repiping, and water softener installation. That does not automatically make that person the right choice to install lighting circuits. An air conditioning contractor may be highly qualified for air conditioning repair, refrigerant-related service, equipment maintenance, and heat pump installation. That does not make fixture layout and lighting controls an afterthought. An electrician may be the right professional for wiring, panels, circuiting, and electrical installations. A lighting contractor with electrical competence and relevant experience brings a focused eye to how illumination will function once the work is complete.

This is not about trade snobbery. Tradespeople who know their lane usually respect other lanes. The problem starts when a project treats lighting as a minor accessory rather than part of the installed electrical system. That is

how buildings end up with service areas that are underlit, switches in awkward locations, fixtures mounted in conflict with ducts, and controls that confuse everyone except the person who installed them.

A good lighting contractor does not barge into a job waving a catalog and demanding chandeliers. The better ones ask what else is happening in the ceiling, where the equipment access points are, how the space will be maintained, and whether future service work will be easier or harder because of today's lighting choices.

What lighting contractor services usually affect on an electrical installation

Lighting contractor services can vary by project, jurisdiction, and business model, so it is better to talk in practical categories rather than pretend every contractor offers the same menu. On an electrical installation, the lighting side often touches fixture selection, placement, switching, dimming or control strategy, coordination with other trades, and installation sequencing.

Here is the short version, without turning it into a catalog thick enough to level a wobbly workbench:

1. Fixture placement should account for ceiling structure, ducts, pipes, equipment clearance, access panels, and the way people actually move through the space.
2. Switching and controls should be intuitive, reachable, and matched to the room's use rather than placed wherever wiring happened to be easiest.
3. Service areas need practical illumination, especially around HVAC equipment, water heaters, valves, panels, drains, and mechanical access points.
4. Installation sequencing should avoid rework when plumbing, ductwork, or heating and cooling equipment changes the available space.
5. Coordination with an electrician, plumber, heating contractor, or air conditioning contractor should happen before the ceiling is closed and everyone suddenly becomes philosophical about mistakes.

That is one list, and it is enough. The rest belongs in the messy, useful world of examples.

The mechanical room test

If you want to judge whether lighting was treated seriously, walk into the mechanical room.

A finished living room can hide a lot of sins behind attractive fixtures. A mechanical room tells the truth. Can you see the furnace clearly? Is the water heater area illuminated? Are switches easy to find? Is the lighting blocked by ductwork? Are fixtures mounted where a technician can safely access them? Can labels be read without using a phone flashlight? Does the layout make future air conditioning maintenance, furnace repair, or water heater repair less irritating?

Mechanical spaces bring together exactly the trades that make coordination important. OSHA's plumbing, heating, and air-conditioning classification includes air-conditioning work, furnace repair, heating equipment installation, plumbing repair, refrigeration and freezer work, sewer hookups, sump pump service, and water pump installation. That is a crowded dance floor. Lighting cannot pretend it is alone.

For example, a heat pump installation may involve indoor and outdoor equipment, controls, refrigerant-related work, and electrical connections. ENERGY STAR notes that proper HVAC installation includes correct equipment sizing and refrigerant charging, and that proper charging of an air conditioner or heat pump can reduce energy use and lower failure risk. The lighting contractor is not sizing the heat pump or charging refrigerant. Still, the lighting plan can help or hinder the people who install and maintain that equipment. Put a fixture where it blocks

access, and you have created a nuisance. Put good light near the service side, and you have quietly improved every future visit.

That is the kind of contribution nobody applauds on day one. Five years later, when a technician can see what they are doing, it feels like genius.

Kitchens, bathrooms, utility rooms, and other coordination traps

Lighting in kitchens and bathrooms often collides with plumbing decisions. Sinks, venting, drain lines, cabinetry, mirrors, fans, and water lines all affect where lighting can go. A lighting contractor who ignores the plumber may discover that the “perfect” fixture location is perfect only in a parallel universe where pipes do not exist.

Bathroom lighting is especially unforgiving. A fixture centered over a vanity looks easy until the actual plumbing layout, mirror size, wall framing, and ventilation choices have their say. Utility rooms have a different problem. They are often treated as leftover space. Then the homeowner expects a water softener installation, washer hookups, storage, drain access, and serviceable lighting to coexist in a room the size of a generous closet. That requires planning, not optimism.

Basements add their own comedy. Drain cleaning equipment may need access. Rooter service may involve cleanouts that should not be hidden behind permanent obstructions. Hydrojetting is not a lighting task, of course, but the service technician still benefits from adequate illumination and access. Lighting should not block cleanouts, valves, or service pathways. The best time to think about this is before everything is finished, not after someone says, “Can we just move that fixture?” which is contractor code for “This will cost more now.”

In kitchens, lighting around appliances and work areas should be planned alongside mechanical and plumbing needs. If a project includes gas installation service, ventilation changes, water lines, or electrical updates, the lighting plan belongs in the same conversation. Separate trades can do separate work while still sharing the same map.

HVAC equipment changes the lighting conversation

Heating and cooling work affects lighting more often than property owners expect. Ductwork steals ceiling space. Air handlers require service clearance. Refrigeration equipment may need accessible areas. Thermostats and controls need thoughtful placement. Filters need to be reachable. Panels need room to open. A gorgeous light fixture installed in the wrong spot can become a very expensive obstacle with a nice finish.

The HVAC field itself is specialized. The U.S. Department of Energy describes HVAC contractors as specialists whose core work involves installing and maintaining heating, ventilation, and air-conditioning equipment. ACCA, a national trade association referenced by federal energy and environmental agencies, represents contractors who design, install, maintain, and service HVACR systems across residential, commercial, industrial, institutional, and governmental settings. That range should tell you something: mechanical systems are not side quests.

Air conditioning repair and service also carry their own regulatory context. EPA definitions under Section 608 treat air conditioners and other refrigeration equipment as appliances, and technicians involved in maintenance, service, or repair can include installers and contractor employees. Again, a lighting contractor is not doing refrigerant work unless properly qualified for that work. But lighting affects the workspace around that equipment. Clear visibility supports careful maintenance, service, and repair.

An air conditioning tune-up often includes inspection and adjustment work where visibility matters. Air conditioning maintenance may involve checking components, access areas, and equipment condition. Even if the

technical tasks belong to the HVAC technician, the lighting installation can make the difference between a clean service visit and a cramped little opera of frustration.

Commercial spaces care about lighting because maintenance never sleeps

In commercial and institutional settings, lighting around equipment can be even more important because service work may happen after hours, in tighter schedules, or in areas where downtime costs money. A lighting contractor working on electrical installations in these environments has to think beyond visual comfort. The installation should support maintenance access, building operations, and trade coordination.

A commercial mechanical area may include HVAC equipment, plumbing systems, water heaters, pumps, ductwork, and electrical infrastructure. If lighting is insufficient, every contractor who enters that room works slower. If switches are poorly placed, people waste time. If fixtures are difficult to service, maintenance teams delay lamp or fixture replacement until the space becomes dim enough to qualify as a mystery novel.

The same principle applies to tenant improvements. A new office layout may require lighting changes, but the ceiling may already be full of ductwork, sprinkler lines, plumbing, and cable pathways. The lighting contractor cannot simply draw a neat grid and hope the building cooperates. Buildings rarely cooperate. They negotiate aggressively.

Residential jobs have fewer hiding places than homeowners think

Homeowners often notice lighting quality in living spaces first. That is fair. Nobody wants a kitchen that makes lettuce look suspicious or a hallway that feels like a submarine. But residential lighting contractor services for electrical installations should also look at the practical rooms.

A homeowner may call a plumber for water heater repair, a septic system service provider for system issues, an air conditioning repair service for cooling problems, or an electrician for electrical trouble. Those visits go better when lighting has been planned with service in mind. It is not glamorous, but it is sensible.

I have seen utility lighting treated like the last slice of pizza at a job meeting: someone takes it because it is there, not because it is good. The fixture ends up behind ductwork. The switch lands behind a door. The area near the furnace stays shadowed. Then, years later, every technician who enters the room silently judges the installation. Tradespeople are polite out loud. Their eyebrows are less restrained.

Better residential lighting does not always mean more fixtures. Sometimes it means placing them where they count. A single fixture in the right location can outperform three fixtures blocked by pipes and ducts. A switch at the logical entrance can matter more than a fancy control nobody understands. Good lighting feels obvious after it is installed, which is why it is so easy to undervalue before the work begins.

The quiet art of not creating rework

Rework is where budgets go to develop a drinking problem.

Lighting installation should be coordinated early enough that conflicts are visible before materials are installed. If a ceiling will hold ducts, piping, recessed fixtures, fans, and access panels, somebody has to decide what goes where. Waiting until rough-in is complete can turn easy adjustments into expensive changes.

The order of trades depends on the project, but the principle stays the same. Mechanical, plumbing, and electrical work should not be designed in isolation. A lighting contractor should understand enough about

adjacent trades to ask good questions. Where will the duct run? Where does the plumber need access? Will the heating equipment require clearance? Is there a water heater installation planned? Will plumbing repiping change the ceiling or wall cavities? Is the air conditioning contractor adding equipment that changes access needs? Are there future maintenance requirements that should affect fixture placement?

Nobody needs a lecture in the middle of a job. They need coordination. There is a difference. A useful contractor walks the site, marks conflicts, talks plainly, and solves problems before drywall turns every decision into archaeology.

Electrical installations tied to comfort systems

Comfort systems often depend on electrical work even when the main trade is HVAC. Heat pump installation, air conditioning equipment, furnaces with controls, and ventilation systems all involve electrical considerations. DOE materials recognize that HVAC contractor services may include plumbing and electrical work associated with heating and cooling equipment. That association does not erase the distinction between trades, but it does explain why these jobs overlap on site.

Lighting near comfort equipment should be treated as part of a serviceable environment. If a technician cannot see the access panel, cannot read equipment information, or cannot safely identify surrounding conditions, the lighting has failed a basic practical test. The fixture may work electrically, but the installation has not served the building.

This is especially true in attics, crawlspaces, basements, closets, and mechanical alcoves. These spaces are rarely generous. They may be hot, cold, dusty, awkward, or all four, because apparently buildings have hobbies. Lighting in these areas should respect access and durability. A delicate fixture in a rough service area is a mismatch. So is a layout that leaves the service side of equipment in shadow.

When “just add a light” is not enough

The phrase “just add a light” has caused more trouble than it deserves. Sometimes adding a light is straightforward. Sometimes it reveals circuit limitations, access problems, fixture support issues, control complications, or conflicts with other systems. A lighting contractor has to know when the simple request is actually simple and when it is wearing a fake mustache.

Adding lighting to an older utility room, for example, may involve working around existing plumbing repair areas, aging equipment, limited ceiling access, and awkward switch locations. Adding lighting near HVAC equipment may require understanding clearance and service space. Adding lighting in a finished basement may involve avoiding ducts, drain lines, and structural members while preserving access for future roofer service or plumbing leak repair. The work may still be worth doing, but it should be scoped honestly.

That honesty is one reason experienced contractors ask questions that seem unrelated at first. Are you replacing the water heater soon? Planning air conditioning maintenance or equipment upgrades? Considering water softener installation? Has a heating contractor mentioned furnace replacement? Any planned plumbing repiping? Those answers can change where lighting should go and how much access is needed.

A contractor who asks those questions is not being nosy. They are trying to avoid installing something today that has to be moved next month.

What owners should ask before hiring

Hiring for lighting contractor services should involve more than picking the person who says, “Sure, we can do that,” fastest. Speed is lovely when ordering lunch. It is less lovely when wiring and building systems are involved.

Ask practical questions. Listen for answers that mention coordination, access, controls, and serviceability. A good contractor should be comfortable discussing how lighting will interact with HVAC, plumbing, and electrical infrastructure. They should also be clear about what they do directly, what requires an electrician, and when another trade should be involved.

Useful questions include:

1. How will fixture placement avoid conflicts with ductwork, piping, access panels, and mechanical equipment?
2. Who handles the electrical installation work, and how are trade responsibilities divided?
3. Will the lighting layout support future service for HVAC equipment, water heaters, valves, drains, and panels?
4. How will switches or controls be placed so the space works naturally?
5. What should be coordinated before walls or ceilings are closed?

That is the second and final list. Sensible questions, no confetti.

The best lighting contractors think like maintenance people

The difference between average and excellent lighting work often appears years later. Average work illuminates the room on the day of completion. Excellent work still makes sense after equipment has been serviced, filters have been changed, water heaters have been replaced, and somebody has crawled in to find a leak.

A lighting contractor who thinks like a maintenance person will avoid blocking access. They will place light where hands and eyes need it. They will understand that a technician performing air conditioning repair does not want to work in shadow. They will remember that a plumber clearing a drain or checking a leak needs visibility near the problem, not mood lighting near the laundry basket. They will think about the heating contractor who has to open a furnace panel. They will consider the electrician who may later need clear working space and identifiable equipment.

This mindset does not require drama. It requires walking the space with a practical eye. Where will a person stand? What will they need to see? What might be replaced in the future? What will be annoying to access? What looks fine on paper but foolish in the ceiling?

The trades have a saying for this, though usually with more colorful vocabulary: build it so the next person does not curse you.

Lighting quality is also safety’s quieter cousin

It is easy to overstate lighting as though every dim bulb is a catastrophe waiting with a clipboard. Still, poor visibility does create avoidable problems. People misread labels. They miss leaks. They struggle with shutoffs. They work slower around equipment. They improvise with portable lights in awkward positions. None of that improves the job.

Good lighting does not replace proper training, qualified trades, or code-compliant work. It supports them. A qualified air conditioning repair service technician still needs the right skills. A plumber still needs plumbing expertise. An electrician still needs electrical competence. A lighting contractor still needs to install lighting properly. The point is that illumination helps each specialist do the work with fewer obstacles.

For heating and cooling systems, proper installation and maintenance already carry energy and reliability implications. ENERGY STAR notes that correct equipment sizing and proper refrigerant charging matter for air conditioners and heat pumps. Lighting does not decide those technical factors, but a serviceable installation environment helps technicians inspect, maintain, and repair equipment more effectively. The light is not the hero. It is the stage manager, which in most productions is the person quietly preventing disaster.

A practical standard: can the next trade do their job?

Here is a grounded way to judge a lighting installation: can the next trade do their job without fighting the lighting?

Can the air conditioning contractor access the equipment? Can the heating contractor see the service area? Can the plumber reach the valve, drain, water heater, or softener? Can the electrician identify and work around the electrical components involved? Can someone performing septic system service, where relevant to the property's systems and access points, navigate associated utility areas without guessing in the dark? Does the lighting support the building's real maintenance life, or does it merely look acceptable during a walkthrough?

The best installations are not always flashy. Often they are calm, logical, and boring in the most beautiful way. The switch is where your hand expects it. The fixture lights the service side of the equipment. The ceiling layout avoids duct conflicts. Access panels remain usable. Future repairs do not require demolition, contortion, or prayers to the patron saint of forgotten junction boxes.

That kind of work takes coordination. It takes a lighting contractor who respects the electrician, plumber, HVAC technician, heating contractor, and every other specialist whose work shares the space. It also takes an owner or project manager who understands that the cheapest lighting decision can become the most irritating maintenance problem.

Electrical installations deserve lighting that works after the invoice is paid

Lighting contractor services for electrical installations sit at an interesting crossroads. They are visual, technical, practical, and deeply dependent on coordination. The work may be part of a larger construction project, a renovation, a mechanical upgrade, or a service improvement. Whatever the setting, lighting should be planned with the building's systems in mind.

A property with plumbing, heating, ventilation, air-conditioning, water heating, drainage, and electrical systems is not a blank canvas. It is a busy machine with walls. The lighting contractor's job is to make the space usable without creating conflicts for the trades that keep that machine running.

Good lighting helps the homeowner find the switch at midnight. Better lighting helps the furnace repair service technician see the panel, the plumber trace the leak, the air conditioning maintenance crew inspect the equipment, and the electrician work without muttering. Best of all, good lighting rarely calls attention to itself. It simply works, year after year, while everyone else gets the applause, the emergency calls, and occasionally the wet socks.

That is a fair bargain. A well-lit installation does not need to be dramatic. It needs to be thoughtful, coordinated, durable, and placed by someone who understands that buildings are serviced long after they are photographed. Give the lighting contractor a seat at the planning table early, and the whole project gets a little less ridiculous. In construction and service work, that counts as a major [water heater installation service](#) victory.

Name: Service Lion Plumbing Heating Air Electric

Address: 521 W Briardale Ave, Orange, CA 92865, United States

Phone: (657) 567-7305

Website: <https://callservicelion.com/>

Email: servicerequests@callservicelion.com

Hours:

Monday: Open 24 hours

Tuesday: Open 24 hours

Wednesday: Open 24 hours

Thursday: Open 24 hours

Friday: Open 24 hours

Saturday: Open 24 hours

Sunday: Open 24 hours

Open-location code: R48R+WV Orange, California, USA

Local Service Information

Service Lion Plumbing Heating Air Electric provides plumbing, drain, heating, air conditioning, and electrical services from its Orange, California location.

The company serves homeowners and properties throughout Orange and communities across Orange County and surrounding areas.

Available services include plumbing repairs, water heater work, drain and sewer services, heating and cooling service, electrical repairs, panels, lighting, outlets, and related home-system work.

Service is available for residential properties as well as light commercial needs described within the company's local service-area information.

The company's website emphasizes locally operated service, coordinated home-system support, and practical scheduling for plumbing, HVAC, and electrical needs.

The matching public business listing shows the Orange location as open 24 hours a day, seven days a week.

For service information or scheduling, call (657) 567-7305 or visit <https://callservicelion.com/>.

The public map listing identifies the business at 521 W Briardale Ave, Orange, CA 92865 and can be used for location and direction information.

Popular Questions About Service Lion Plumbing Heating Air Electric

What services does Service Lion Plumbing Heating Air Electric provide?

The company provides plumbing, drain and sewer, heating, air conditioning, and electrical services. Its published services include plumbing repair, water heaters, drain clearing, sewer work, HVAC repair and installation, electrical repairs, panels, circuit breakers, lighting, outlets, and related services.

Where is Service Lion Plumbing Heating Air Electric located?

The matching business location is 521 W Briardale Ave, Orange, CA 92865, United States.

What areas does Service Lion Plumbing Heating Air Electric serve?

The company serves Orange County and surrounding communities. Its published service-area information includes Orange, Anaheim, Brea, Yorba Linda, Fullerton, Huntington Beach, Newport Beach, Costa Mesa, Irvine, Lake Forest, and additional nearby cities.

Is Service Lion Plumbing Heating Air Electric open 24 hours?

The matching public business listing shows the location as open 24 hours on Monday through Sunday.

Does Service Lion Plumbing Heating Air Electric work on drains and sewer lines?

Yes. Published services include drain clearing, roofer service, camera inspection, hydro jetting, sewer line repair and installation, water line work, slab leak detection, and trenchless sewer line repair.

Does Service Lion Plumbing Heating Air Electric provide heating and air conditioning service?

Yes. Its published HVAC services include air conditioning repair and installation, heating service, furnace work, heat pumps, air ducts, indoor air quality assessments, and thermostat installation.

Does Service Lion Plumbing Heating Air Electric provide electrical service?

Yes. Published electrical services include repairs and installations, electrical panels, circuit breakers, safety inspections, lighting, outlets and switches, surge protection, generators, and EV charging equipment installation.

How can I contact Service Lion Plumbing Heating Air Electric?

Call [\(657\) 567-7305](tel:6575677305).

Landmarks Near Orange, California

Old Towne Orange Historic District

A central historic district and useful geographic reference point for the Orange community.

Plaza Park

A well-known public gathering point in the center of Old Towne Orange.

Orange Public Library & History Center

A civic landmark serving residents near central Orange.

Hart Park

A major public park and recreation area south of central Orange.

Eisenhower Park

A public park serving neighborhoods in northern Orange.

Santiago Oaks Regional Park

A regional recreation and open-space landmark on the eastern side of Orange.

Irvine Regional Park

A large regional park and recognizable reference point east of the city.

Orange Park Acres

A distinctive residential community and service-area reference point in eastern Orange.

El Modena

An established Orange neighborhood that provides a practical local coverage reference.

Glassell Street

One of the city's principal north-south streets and a useful route through central Orange.

Lincoln Avenue

A major east-west roadway serving northern Orange and nearby communities.

State Route 55

A primary regional freeway connecting Orange with other parts of Orange County.
