The property is simple:

1. The gamer positions a wager in their picked cryptocurrency (e.g., Bitcoin, Ethereum, GBPT, or Dogecoin).
2. The player sets a **target multiplier** (e.g., 2x, 10x, 100x, or perhaps 1,000,000 x).
3. The game produces a random multiplier outcome.
4. If the produced multiplier is **greater than or equivalent to** the target multiplier, the player wins. If it fails, the bet is lost.

How Limbo Works: The Mechanics Behind the Multiplier

To truly comprehend Limbo, one should take a look at how the math runs under the hood. The game depends on a house edge, which usually varies from 1% to 2% depending upon the particular crypto gambling establishment being utilized.

When a gamer chooses a target multiplier, the game immediately determines the specific win likelihood based on that multiplier and your home edge.

The Core Equation

Normally, the win opportunity is calculated as:

$$\text{Win Chance (\%)} = \frac{100 - \text{Home Edge (\%)}}{\text{Target Multiplier}}$$

For example, on a platform with a 1% house edge:

- If a gamer sets a target of **2.00 x**, the win chance is roughly **49.5%**.
- If a gamer sets a target of **10.00 x**, the win chance drops to **9.9%**.
- If a player sets a target of **100.00 x**, the win opportunity plummets to **0.99%**.
