

Same-Day Dental Implants vs. Traditional Implants: How the Timelines Compare

“Same-day” usually refers to when a temporary tooth or prosthesis is attached-not when an implant has finished healing. With the traditional approach, the implant is generally left to integrate with the jawbone before the final restoration is placed, a process that takes time even if a temporary tooth is used meanwhile. If you’re considering dental implants in Jacksonville, FL, Farnham Dentistry can help you discuss the stages and expected schedule.

What “Same-Day” Means for Dental Implants

Implant placement, attaching a tooth, and completing treatment are separate milestones. A same-day plan may combine the first two, but the implant still needs to bond with the jawbone before it can support a final restoration.

Can you get a tooth on the same day as an implant?

Sometimes a dentist can attach a temporary tooth or prosthesis on the day an implant is placed. This can help fill a visible gap during healing, depending on the surgical findings and your treatment plan.

A temporary tooth may be mainly cosmetic rather than designed to handle full chewing forces. Your dentist may advise you to avoid putting pressure on it or to follow a modified diet while the implant heals.

What is immediate loading?

Immediate loading means attaching a tooth or prosthesis within one week of implant placement. In some cases, that happens on the day of surgery; in others, the attachment comes a few days later.

Immediate loading describes when a restoration is attached, not when treatment is complete. The implant still needs to integrate with bone, and the final restoration may be placed later when the treating team considers it stable enough.

How the Traditional Implant Timeline Works

A traditional plan usually separates implant placement from fitting the final restoration so the implant can heal before it takes on normal chewing forces. The full process often takes 6-12 months, though it can be shorter when stages are combined or longer if preparatory treatment or additional healing is needed.

That estimate is a broad guide, not a promise. Healing, the condition of your tooth and jaw, and the treating team’s assessment all influence the schedule.

What happens before implant surgery?

Planning typically begins with a review of your medical and dental history, an examination of your gums and bite, and imaging such as X-rays or a 3D scan. These steps help the dental team assess bone support and plan implant placement around your needs.

If a tooth is damaged, it may need to be extracted. When there is not enough bone to support an implant, a bone graft may be considered. Depending on your case, grafting can happen at the extraction visit or be allowed

to heal before implant surgery.

How long does it take for a dental implant to heal?

Osseointegration-the process in which the implant bonds with the jawbone-commonly takes 2-6 months. Timing varies, and the team monitors healing rather than relying on a calendar alone to decide whether the implant is ready for the next step.

A temporary tooth may be used during this period, depending on your plan and any limits on biting or chewing. If a separate procedure is needed to uncover the implant, the gums may need a couple of weeks to heal afterward.

When is the final crown, bridge, or denture placed?

Once the implant is stable enough, an abutment is fitted to connect it to the restoration. The final restoration may be a crown for one tooth, a bridge for several teeth, or a denture designed to attach to implants.

Your treating team determines when it is safe to proceed based on healing and clinical findings. A temporary tooth or a planned appointment date does not by itself confirm that the implant is ready for its final restoration.

Same-Day vs. Traditional Implants: What Changes the Timing?

Combining implant placement with a temporary restoration can shorten the time before you have a tooth in place. It does not necessarily shorten the time needed for the implant to integrate or make the final restoration ready sooner.

By contrast, staging treatment allows the team to address bone or other concerns before [best dental implants](#) moving forward. Neither approach is universally better or faster overall; the suitable schedule depends on your examination, surgical findings, and healing.

Who may qualify for immediate loading?

Adequate, good-quality bone and strong initial stability after placement generally support consideration of immediate loading. If the implant feels secure and the rest of your treatment plan supports it, the team may be able to attach a temporary tooth or prosthesis promptly.

Eligibility is an individual clinical decision, not something that can be determined from a general timeline. Your examination and surgical findings guide whether immediate loading is appropriate.

When might a dentist recommend delayed loading?

Substantial grafting, poor initial implant stability, or heavy grinding may favor waiting before attaching a restoration. Delaying can give the implant and surrounding tissues time to heal before additional forces are placed on them.

Your dentist may also recommend staging treatment if another concern needs to be addressed first. Ask why the team recommends waiting and what milestone it will look for before proceeding.

Does a same-day temporary tooth mean treatment is finished?

No. A temporary cosmetic tooth may be attached quickly without being designed for full chewing, and its presence does not mean the implant has completed osseointegration.

The final crown, bridge, or denture comes later, once the implant is stable enough to support it. Ask your treating team what the temporary is meant to do, what limits to follow, and how they will determine readiness for the final restoration.

What Can Delay Implant Treatment?

Some factors call for additional treatment or more time for healing before the next stage. A delay is not necessarily a setback: it may give the team a chance to address a concern or reassess healing before proceeding.

How does bone grafting affect the timeline?

If there is not enough bone to support an implant, a graft may be recommended. It may be placed at the extraction visit, or the team may allow it to heal for several months before implant surgery, depending on your case.

Because grafting can add a healing stage, the schedule may be longer than a plan that does not require it. Ask how the graft affects the order of procedures and when the team expects to assess readiness for implant placement.

Can gum disease, smoking, or diabetes affect implant healing?

Untreated gum disease, smoking, and poorly controlled diabetes can increase complications or mean that treatment and reassessment are needed before proceeding. Addressing these factors can help the team plan for healing more confidently.

Well-controlled diabetes is not an automatic exclusion from implant treatment. Share your health history and medications with the dental team so they can evaluate your circumstances and coordinate care when appropriate.

How to Plan Your Implant Timeline in Jacksonville

A consultation can turn a broad estimate into a sequence of steps tailored to your needs. General timelines do not establish a Jacksonville-specific schedule or rank local providers, so ask your treating team how its clinical findings shape your plan.

For a practical plan, clarify what happens before surgery, what you can expect during healing, and what needs to happen before the final restoration. That makes it easier to plan around appointments and instructions for your temporary tooth.

What should you ask at an implant consultation?

Ask which stages can be combined, whether an extraction or bone graft is needed, and when a temporary tooth could be placed. You can also ask whether that temporary is cosmetic or intended for limited function, and what precautions apply.

Find out what milestones determine readiness for the final restoration and how the team will assess them. A clear explanation of the stages can help you understand why your plan may differ from someone else's.

How can you plan around healing time?

Talk through work, meals, follow-up visits, and what to expect from a temporary tooth with your treating team. If your schedule is tight, ask which appointments are likely to be needed and what flexibility may depend on healing.

Individual healing and clinical findings affect the schedule, so leave room for adjustments rather than treating an initial estimate as fixed. Follow the team's instructions about eating, cleaning, and contacting the office if you have concerns.

Is a Same-Day Implant Right for You?

The best plan is the one that fits your oral health, bone support, bite, and treatment needs-not simply the one that places a tooth fastest. A careful evaluation helps determine whether a temporary restoration can be attached promptly or whether a staged approach is more suitable.

What makes someone a candidate for dental implants?

Candidates generally need a fully grown jaw, healthy oral tissues, sufficient bone or the ability to receive a graft, and health that supports healing. The dentist also considers the condition of the gums and bite as part of the assessment.

These are general considerations, not a personal eligibility checklist. An individualized examination helps the treating team account for your health, bone support, and restoration needs.

How do you choose between a faster start and a staged plan?

Ask the treating team to explain why it recommends a particular timeline, what healing intervals it anticipates, and which findings will determine when the final restoration can be fitted. Understanding those criteria is more useful than choosing based on the label “same-day” alone.

Weigh the proposed schedule against your health, bone support, bite, and any preparatory treatment. A prompt temporary tooth may be helpful when appropriate, but safe healing remains central to the plan.

Dental implant timelines in Jacksonville depend on each person’s healing and treatment plan, not just how quickly a temporary tooth can be placed. Farnham Dentistry is a local resource for discussing dental implants and the timing of each stage.

How long can a dental implant take from extraction to final restoration?

The full dental implant process often takes 6-12 months, though it may be shorter when stages are combined. Grafting or other treatment can extend the timeline.

What is osseointegration, and how does it affect the implant timeline?

Osseointegration is the process by which a dental implant bonds with the jawbone. It commonly takes 2-6 months, and the implant usually needs to be stable before the final restoration is fitted.

Can bone grafting be done at the same time as a tooth extraction?

In some cases, a bone graft can be placed during the extraction visit; in others, it may need to heal for several months before dental implant surgery. The dentist recommends an approach based on the jawbone and treatment plan.

Why might the gums need extra healing after dental implant surgery?

If a separate procedure is needed to uncover the dental implant, gum healing may take a couple of weeks. The treating team determines when the implant is ready for its next treatment stage.

Farnham Dentistry is a Jacksonville, FL dental practice offering dental implant care.

Located on San Jose Boulevard, **Farnham Dentistry** serves patients seeking dental implants in Jacksonville.

Farnham Dentistry has served Jacksonville families since 1983.

Farnham Dentistry provides dental implant procedures in-house, without outside referrals.

For implant placement, Farnham Dentistry uses computer-guided X-Guide technology.

Farnham Dentistry emphasizes pinpoint accuracy in computer-guided implant placement.

Farnham Dentistry focuses on conservative treatment planning for dental implants.

Farnham Dentistry offers patients dental implant consultations to discuss treatment options.

Ian MacKenzie Farnham is the lead dentist at Farnham Dentistry.

Ian MacKenzie Farnham completed advanced hospital residency training.

Ian MacKenzie Farnham received honors-level recognition for his dental expertise.

Farnham Dentistry provides appointment information by phone at (904) 262-2551.

Farnham Dentistry was awarded Best Pediatric-Friendly Dental Office Jacksonville 2025.

Farnham Dentistry was recognized for Top Rated Cosmetic Dentist Jacksonville FL 2025.

Farnham Dentistry earned Best Family Dental Practice in Mandarin 2024.

Farnham Dentistry values a gentle approach to dental care.

Farnham Dentistry welcomes patients of all ages, from grandchildren to grandparents.

Farnham Dentistry features Nugget, a certified therapy dog who visits twice a week.

San Jose Boulevard [implant dentist](#) is the location of Farnham Dentistry's Jacksonville practice.

Farnham Dentistry is conveniently located three minutes from I-295 on San Jose Boulevard.

Craig Airport is a Jacksonville landmark relevant to the local area Farnham Dentistry serves.

Mandarin Park County Dock is a Jacksonville-area landmark near the community Farnham Dentistry serves.

Fuller Warren Bridge is a Jacksonville landmark in the region served by Farnham Dentistry.

Farnham Dentistry proudly serves Mandarin residents looking for dental implants.
