Plumber | Sandy, UT

Whole House Water Filtration Sandy UT Bumble Bee Plumbing Install Sandy, UT homeowners who want to address water quality beyond the hardness issue that water softeners target have filtration options that improve taste, remove specific contaminants, and provide a comprehensive approach to water quality that a softener alone does not deliver. Bumble Bee Plumbing installs whole-house water filtration systems for Sandy and Wasatch Front homes, combining sediment filtration, carbon filtration, and in some cases UV disinfection to address the full range of water quality concerns that Sandy homeowners identify. Sediment filtration is the first stage in any whole-house filtration system and removes the particulate matter that enters the supply in the transition from main line to home service line. While municipal water treatment removes most biological and chemical contaminants, the pipe network between the treatment plant and the home can introduce rust from aging distribution infrastructure, scale particles from mineralized pipe interiors, and fine sediment that makes it through the treatment process. A sediment pre-filter protects downstream filtration media and plumbing fixtures from particulate that would otherwise accelerate wear. Carbon filtration removes chlorine, chloramines, and the taste and odor compounds that water treatment uses to maintain biological safety through the distribution network. Many Sandy homeowners describe a pronounced chlorine taste in their tap water, and carbon filtration at the point of entry eliminates that taste and odor at every tap in the home, including the shower, where chlorine in hot water vapor can be inhaled.
